

SIMPLE ASYMMETRIC ARROW: one triangular head + one thick tail. Two shapes.

The POINT is the car's front. FRONT arrow above shows which way.

The tail is what makes the direction unique — a bare triangle has three plausible directions, and the matcher would find all of them.

Measured symmetry check: 0 deg 0.989, 120 deg 0.587, 180 deg 0.762 — so at threshold 0.85 only the true direction passes.

Print 100%, normal quality. Cut outside the white square; keep the white border — it is the contrast against the roof. Measure the 100 mm line.
